# </ What did you (or your students) like the most?

For the two groups that finished the project at Scratch, this activity was the one they liked the most.

The remaining students were more happy to build and play "AlgebraScrabble". They also really enjoyed working on the "Cloud".

What I liked the most was observing the interest and motivation with which the students worked.

# What did not go so well?

The main problem was the number of classes in which it was possible to work on the project, since most students do not have a computer at home.

I wish I had more time to work on the project.

# What did you learn from your experience?

I confirmed that students work with more enthusiasm and motivation when using computational tools and manipulative materials. They may continue to express difficulties, but feel more motivated to overcome them.
